

Railroad Contractor

Railroad Contractors Perform Railroad Track Construction and Railroad Track Maintenance.

There are four main areas of railroad work:

Railroad track roadbed preparation— this includes clearing, grading, subgrade and sub-ballast, and drainage. This is the beginning phase of a new project which prepares the ground surface to support the railroad tracks. Railroad maintenance or repair can also be performed on the track roadbed. [More...](#)

Railroad track construction and railroad switches – To construct track, this is the laying of the track itself including the switches—a mechanical installation-- which allows for guiding the train onto varying lanes of track. This work ranges from industrial tracks to complex switching leads and welded rail running tracks and yards. [More...](#)

Railroad crossings, railroad signals and railroad platform crossings – This includes preparation of the point at which rails cross roads and other platforms and includes the use of asphalt, concrete, rubber, steel and wood materials. Signals are electrical or mechanical equipment stationed along railway lines to communicate the status of the lines to train controllers. [More...](#)

Crane rail construction and direct fixation track—this is a specialty area of railroad installation, repairs and maintenance of industry and port crane rail systems for the purpose of lifting and carrying goods and materials. [More...](#)
